

QPhase[™] *Encoders*

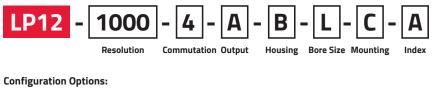

LP12

DESIGN FEATURES

- Low profile assembled height of 0.816"
- Bearing design simplifies encoder attachment
- Incremental resolutions up to 20,000 PPR
- Sin/Cos outputs available up to 1250 PPR
- 4, 6 or 8 pole commutation¹
- 1.280", 1.575" or 1.812" bolt circle mounting
- Through bore sizes up to 0.3125" (8 mm) diameter
- High noise immunity
- Cost competitive with modular encoders
- 500 kHz frequency response
- RoHS construction

Quantum Devices, Inc. Model LP12 provides an improved feedback solution in applications typically using modular encoders. With an overall height of less than an inch and the stability of a bearing encoder design, the model LP12 can provide significant performance upgrades in applications limited by traditional modular encoder solutions. Outputs consist of a quadrature with index pulse (incremental or sinusoidal) and three-phase commutation. A flexible spring steel mount allows for much greater tail shaft run out and TIR than can be tolerated by modular encoder designs, while also providing 30 degrees of rotation for commutation timing.

3. 2094AG039 and 2095AG019 can be used with Output option A or C to provide TTL UVW signals

ENCODER INSTALLATION INSTRUCTIONS

- 1. Remove two cap screws using an IP5 Torx Plus driver and remove encoder cap, exposing brass hub.
- 2. Using two fingers slide the encoder onto shaft.
- 3. For additional security, Loctite can be applied to the encoder hub set screws. Remove the encoder's set screws and using tip of toothpick apply appropriate amount of Loctite thread locking adhesive. A non-permanent adhesive is recommended.
- 4. Insert and tighten encoder set screws using a 0.050" hex driver. Torque range of 28-32 oz.in.
- 5. Fixture the stainless steel flex mount to the mounting surface with #6-32 button head screws.
- 6. Replace encoder cap and re-install two cap screws. Torque range of 12–24 oz·in.

For brushless motors requiring commutation timing:

- Encoder drawings indicate position of encoder hub to encoder body at Z (index). Rotating the hub to this position allows for known U channel transition state (prior to step one above).
- Powering appropriate motor windings allow for locking motor shaft location to match the appropriate U transition (prior to step one above).
- While mechanically back driving the motor, monitor motor winding EMF position to the powered encoder position. Rotate the encoder stainless steel flex mount to achieve accurate timing of encoder commutation feedback channels to the appropriate motor winding EMF. Tighten the screws retaining the encoder stainless steel flex mounts.
